Patent No. 5851817

GENERAL INFORMATION:
APPLICANT: Hardy, Daniel M.
APPLICANT: Garbers, David L.
TITLE OF INVENTION: Specimes-Specific Egg-Binding Proteins of TITLE OF INVENTION: Sperm
NUMBER OF SEQUENCES: 8
CORRESPONDENCE ADDRESS:
ADDRESSER: Arnold, White & Durkee
STREET: P. O. Box 4433
CITY: Houston
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 92;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Indels

(Patent No. 5872098
GENERAL INFORMATION:
APPLICANT: George P. Vlasuk, Patric H. Stanssens,
APPLICANT: Joris H.L. Mensens, Marc J. Lauwereys,
APPLICANT: Yess R. Larcofte, Laurent S. Jespers,
APPLICANT: Peter W. Bergum
ITLER OF INVENTION: NEMATOBE-EXTRACTED ANTICOAGULANT
ITLER OF INVENTION: PROTEIN
NUMBER OF SEQUENCES: 356
CORRESPONDENCE ADDRESS:
ADDRESSEE: Lyon & Lyon
STREET: 633 Weat Fifth Street
STREET: Suite 4700
CITY: Los Angeles
STREET: Galifornia
COUNTRY: U.S.A.
CIP: 90071

COMPUTER READABLE FORM:
MEDIUM TYPE: 3.5" Diskette, 1.44 Mb
MEDIUM TYPE: Storage
COMPUTER: IBM COMPATIBLE
CORPUTER: IBM COMPATIBLE
CORPUTER: IBM COMPATIBLE
CORPUTER: Word Perfect 5.1

"The isoinhibitors of chymotrypsin/elastase from Ascaris
lumbricoides: the primary structure.";
Arch. Biochem. Biophys. 232:143-161(1984).
-!- FUNCTION: Defend the organism against the host's proteinases.
-!- SUBCELDULAR LOCATION: Secreted.
-!- SIMILARITY: Contains 1 TIL (Trypsin inhibitory-like) domain.
HSSP; P07851; 12A1.

Submitted (APR-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: METALLOTHIONEINS HAVE A HIGH CONTENT OF CYSTEINE
RESIDUES THAT BIND VARIOUS HEAVY METALLS (BY SIMILARITY).
-!- DOMAIN: CLASS I METALLOTHIONEINS CONTAIN 2 METAL-BINDING DOMAINS:
FOUR DIVALENT IONS ARE CHELATED WITHIN CLUSTER A OF THE ALPHA
DOMAIN AND ARE CORDINATED VIA CYSTEINVI. HIGHOLET BRIDGES TO 11
CYSTEINE LIGANDS. CLUSTER B, THE CORRESPONDING REGION WITHIN THE
BETA DOMAIN, CAN LIGATE THREE DIVALENT IONS TO 9 CYSTEINES.
-!- SIMILARITY: BELONGS TO THE METALLOTHIONEIN SUPERFAMILY; FAMILY 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 GGFGGLGGRGKCPSNEIFSRCDGRCQRFCPNVVPKPLCIKICAPGCVCRLGYLRNKKKVC

-!- FUNCTION: METALLOTHIONEINS HAVE A HIGH CONTENT OF CYSTEINE

RESIDUES THAT BIND VARIOUS HEAVY METALS (BY SIMILARITY).

-!- DOWAIN: CLASS I METALLOCHHONEINS CONTAIN 2 METAL-BINDING DOWAINS:

FOUR DIVALENT IONS ARE CHELATED WITHIN CLUSTER A OF THE ALPHA

DOWAIN AND ARE CORDINATED VIA CYSTEINYL THIOLATE BRIDGES TO 11

CYSTEINE LIGANDS. CLUSTER B. THEE DIVALENT IONS TO 9 CYSTEINS.

BETA DOMAIN, CAN LIGATE THREE DIVALENT IONS TO 9 CYSTEINES.

-!- SIMILARITY: BELONGS TO THE METALLOCHIONEIN SUPERFAMILY; FAMILY 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                           SPECIES=0.mykiss; TISSUE=Liver;

Overnell U., Berger C., Wilson K.J.;
Partial amino acid sequence of metallothionein from the plaice
(Pleuronectes platessa).";
Biochem. Soc. Trans. 9:217-218(1981).
-!- FUNCTION: METALLOTHICNEINS HAVE A HIGH CONTENT OF CYSTEINE
RESIDUES THAT BIND VARIOUS HEAVY METALS (BY SIMILARITY).
-!- DOWAIN: CLASS I METALLOTHICNEINS CONTAIN 2 METAL-BINDING DOMAINS:
FOUR DIVALENT IONS ARE CHELATED WITHIN CLUSTER A ALPHA
DOWAIN AND ARE COORDINATED VIA CYSTEINYL THIOLATE BRIDGES TO 11
CYSTEINE LIGANDS. CLUSTER B, THE CORRESPONDING REGION WITHIN THE
BETA DOMAIN, CAN LIGATE THREE DIVALENT IONS TO 9 CYSTEINES.

-!- FUNCTION: SEEMS TO BIND ZINC AND COPPER. COULD FLAY A SPECIAL ROLE
                       metallothomein gene expression in winter flounder tissues.",
Can. J. Zool. 67:2520-2527(1989).
-!- FUNCTION: METALLOTHIONEINS HAVE A HIGH CONTENT OF CYSTEINE
RESIDUES THAT BIND VARIOUS HEAVY METALS (BY SIMILARITY).
-!- DOMAIN: CLASS I METALLOTHIONEINS CONTRIN 2 METAL-BINDING DOMAINS:
FOUR DIVALENT IONS ARE CHELATED WITHIN CLUSTER A OF THE ALPHA
DOMAIN AND ARE COORDINATED VIA CYSTEINVI. THIOLATE BRIDGES TO 11
CYSTEINE LIGANDS. CLUSTER B, THE CORRESPONDING REGION WITHIN THE
BETA DOMAIN, CAN LIGATE THREE DIVALENT IONS TO 9 CYSTEINES.
-!- SIMILARITY: BELONGS TO THE METALLOTHIONEIN SUPERFAMILY; FAMILY 1.

Kaysen J., O'Hara T., Goodwin T., Linnehan R., Hammond T., Submitted (AUG-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: METALLOTHIONEINS HAVE A HIGH CONTENT OF CYSTEINE RESIDUES THAT BIND VARIOUS HEAVY METALLS (By similarity).
-!- SUBGINIT: Monomer (By similarity).
-!- DOMAIN: CLASS I METALLOTHIONEINS CONTAIN 2 METAL-BINDING DOMAINS: FROME DIVALENT IONS ARE CHELATED WITHIN CLUSTER A OF THE ALPHA DOMAIN AND ARE COORDINATED VIA CYSTEINYL THIOLATE BRIDGES TO 11 CYSTEINE LIGANDS. CLUSTER B, THE CORRESPONDING REGION WITHIN THE BETA DOMAIN, CAN LIGATE THREE DIVALENT IONS TO 9 CYSTEINES.
-!- SIMILARITY: BELONGS TO THE METALLOTHODEIN SUPERFAMILY; FAMILY 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                        Submitted (PAR-1996) to the EMBL/GenBank/DDBJ databases.

Submitted (PAR-1996) to the EMBL/GenBank/DDBJ databases.

-!- PUNCTION: METALLOTHIONEINS HAVY A HIGH CONTENT OF CYSTEINE
RESIDUES THAT BIND VARIOUS HEAVY METALS (BY SIMILARITY).

-!- DOMAIN: CLASS I METALLOTHIONEINS CONTAIN 2 METAL-BINDING DOMAINS:

FOUR DIVALENT IONS ARE CHELATED WITHIN CLUSTER A OF THE ALPHA
DOMAIN AND ARE COORDINATED VIA CYSTEINVL THIOLATE BRIDGES TO 11
CYSTEINE LICANDS. CLUSTER B, THE CORRESPONDING REGION WITHIN THE
BETA DOMAIN, CAN LIGHTE THREE DIVALENT IONS TO 9 CYSTEINES.

-!- SIMILARITY: BELONGS TO THE METALLOTHIONEIN SUPERFAMILY; FAMILY 1.

-!- FUNCTION: METALLOTHIONEINS HAVE A HIGH CONTENT OF CYSTEINE
RESIDUES THAT BIND VARIOUS HEAVY METALS (By similarity).

-!- DOMAIN: CLASS I METALLOTHIONEINS CONTAIN 2 METAL-BINDING DOMAINS:
FOUR DIVALENT IONS ARE CHELATED WITHIN CLUSTER A OF THE ALPHA
DOMAIN AND ARE CORDINATED VIA CYSTEINVL THIOLATER BRIDGES TO 11
CYSTEINE LIGANDS. CLUSTER B, THE CORRESPONDING REGION WITHIN THE
BETA DOMAIN, CAN LIGATE THREE DIVALENT IONS TO 9 CYSTEINES.

-!- SIMILARITY: BELONGS TO THE METALLOTHIONEIN SUPERFAMILY; FAMILY 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukāryota, Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

                                                   designated Api m 6.01. The sequence represents the central mains acid designated Api m 6.01. The sequence represents the central mains acid ABB08333). The specification describes a substantially pure polypeptide, Api m 6, derived from bee venom and found in four isoforms. The proteins of the invention have immunosuppressant activity and may form the basis of a vaccine. Api m 6 is useful for modulating an immune response, i.e. as an allergen for immunocherapy. The protein is useful for identifying an individual at risk for bee venom hypersensitivity. The method response raised, where a detectable immune response indicates that the individual is at risk for bee venom hypersensitivity. Antibodies specific for Abi m 6 are useful for purifying the protein.

The present sequence represents a nematode extracted anticoagulant protein has activity as an anticoagulant and/or serine protein (NAP). The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification of ascentibes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the concentration of the concentration of the concentration of the concentration of the protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (PT) assay; and an ex vivo prothrombin time (PT) assay and an ex vivo prothrom of clotting effected by the isolated protein in each of the PT and apPT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is deemed a two-fold elevation; and calculating a PT to aPTT prolongation ratio, where a ratio at least cone is indicative of factor VIIa/TF inhibitory activity. The method is cone is indicative of factor VIIa/TF inhibitory activity. The method is arrivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            5

anticogulant protein NamnAP. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, dissemband intravascular coaqulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequence can also be used for this) or as diagnostic tests. The protein can also be used as a vaccine against

serine

protein (NAP). The protein has activity as an anticoagulant and/or serir protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification

sequence represents a nematode extracted anticoagulant

describes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo prothrombin time (PT) assay and an ex vivo prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where calculating of clotting time is deemed a two-fold elevation, and calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory genus Chilamydomonas comprising reproductive genetic material comprising a nuclectide sequence capable of expressing chicken type I Metallothionein. Also described is a method of removing metal from an aqueous medium containing at least one dissolved or suspended metals. The transgenic algae are used for the selective separation of metals, particularly the separation of precious and desirable metals such as gold and uranium, from other metals such as cadmium, airc and copper. The method can be used to facilitate the selective recovery of precious and rare metals from mineral sources where aqueous media can be used, such as in natural surface water flows, ground water and where water may be introduced. The method is suitable for well-drilling, soil and water remediation arts, mining fields, and industrial engineering. The present sequence represents a class I metallothionein Metallothionein; metal recovery; remediation; heavy metal; precious metal; phytochelatin; green algae; Chlamydomonas reinhardtii. tissue growth, anglogenesis, activity thrombolytic activity, chemotactic, chemotactic activity, has activity thrombolytic activity, chemotactic, chemotactic activity, has activity, thrombolytic activity, chemotactic, chemotactic activity, has a may be used in the determination of bodily characteristics, fertility and behaviour. ORFX proteins, concleic acids and antibodies may be used in the treatment of cancers, cherry proliferative disorders such as psoriasis and benign tumours, cherry proliferative disorders such as psoriasis and benign tumours, cherry proliferative disorders such as psoriasis and benign tumours, cherry proliferative disorders such as psoriasis and benign tumours, cardiovascular diseases, immune system disorders, disorders related to organ transplantation, disorders of tissue growth and regeneration, disorders mellitus, hypothyroidism, and cholesterol ester corgan transplantation, disorders of tissue growth and regeneration, diseases, and infections diseases caused by viral, bacterial, thungal and other pathogens. OREX nucleic acused by viral, bacterial, chungal and other pathogens. OREX nucleic acused by viral, bacterial, continued to primers and probes, in the detection of OREX genomic sequences are provided in genetic diagnosis, and in forensic biology. The OREX nucleic acids may additionally be used to produce transgenic animals which may be useful for studying the function and/or activity of OREX protein, and in drug screening of OREX proteins may also be used as immunogens to generate specific antibodies, which are useful in the diagnosis, treatment and monitoring of OREX-associated diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A recombinant streptavidin-metallothionein chimeric protein is useful to add or remove heavy metal ions into biotin-containing biological material, particularly for tumour imaging, radiotherapy, and DNA or

used to produce chimeric protein of the invention. The specification describes a recombinant bifunctional streptavidin-metallothionein chimeric protein. This protein is produced by introducing into a host cell mucleic acid encoding a brifunctional fusion protein having a streptavidin and a metallothionein moiety, and incubating the cell to streptavidin and extraction protein. The streptavidin moiety consists of residues 16-133 of mature streptavidin. The chimeric protein is used to incorporate heavy metal ions into biological materials containing biotin, or to remove heavy metal ions from the biological material. Specific uses include loading cancerous tissue with heavy metal ions for include loading cancerous tissue with heavy metal ions for ingent tumour cells and radiotherapy, and labeling DNA and proteins for detection on gels or blots by surface scanning mass spectrometry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated polynucleotide encoding a polypeptide which is related to potato snakin antimicrobial protein and GASA4 or GASA5 or GAST1 homologues, which is referred to as lysine- and cysteine- rich peptides (KCP)-like polypeptide, having a nucleotide sequence from 36 sequences of defined base pairs, given in the specification. A recombinant expression cassette comprising the isolated polynucleotide of the invention is useful for modulating the level of (KCP)-like polypeptides in a plant cell, where the level of (KCP)-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antimicrobial; transgenic; plant; potato snakin antimicrobial protein; GASA4; GASA5; GAST1 homologue; lysine- and cysteine- rich peptide; KCP-like polypeptide; modulating; disease resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotide encoding lysine- and cysteine-rich peptides-like polypeptide useful for modulating the polypeptide level in a plant
                                                           The present sequence represents mammalian metallothionein. It is

The invention relates to nucleic acid sequences which regulate gene expression in an age-related manner and/or in a liver-specific manner. The invention identifies regions of the human factor IX (hFIX) gene, and a region of the human protein C (hFC) gene, which are age-related carejon of the human protein C (hFC) gene, which are age-related carejon of the position 2164-2165 of AAF54019) and are found in the 5' UTR (at position 2164-2165 of AAF54019). These elements act synexcistically concrease hFIX levels over the lifespan of an individual; however, they con increase hFIX levels over the lifespan of an individual; however, they compared the carefacted manner, with ABS' acting to stabilise hFIX mRNA, and AB3' acting to increase hFIX mRNA, and acting the head ordering the age-related regulatory sequences of the invention, along with their homologues, variants and fragments, may be used in the construction of recombinant expression vectors for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Age-related gene regulation; liver-specific; gene expression; man factor IX; hFTX, ABS', AB3', age-regulatable expression construct; antisense therapy; gene therapy; thrombosis; cardiovascular disease; diabetes; Alzheimer's disease; Parkinson's disease; cancer; osteoporosis;
polypeptides is increased, and disease resistance is enhanced. This sequence represents a protein relating to the KCP-like proteins of the

DB 23; Length 62; 23; Indels copper. The method can be used to facilitate the selective recovery of precious and rare metals from mineral sources where aqueous media can be used, such as in natural surface water flows, ground water and where water may be introduced. The method is suitable for well-drilling, soil and water remediation arts, mining fields, and industrial engineering. The present sequence represents a Class II metallothionein given in the present invention.

coagulation (e.g., the pro-coagulants factor IX and factor VIII, and the anti-coagulants protein C and antithrombin III), human alpha-1-antitrypsin, PEA-3 protein and reporter proteins uch as alpha-1-antitrypsin, PEA-3 protein and reporter proteins uch as ludiferase. Preferred promoters for use in such age-regulatable corporation and promoter and the SP6 promoter. The expression vectors of the T3 promoter and the SP6 promoter. The expression vectors of the invention may be used in gene therapy to provide age-related and/or be used in the treatment of such age-related conditions such as thrombosis, cardiovascular disease, diabetes, Alzheimer's disease, Parkinson's disease, cancer, osteoporosis, osteoarthritis and dementia. Parkinson's disease, cancer, osteoporosis, osteoarthritis and dementia. Perkinson's they may be used to express factor IX antisense mRNA in the treatment of thrombotic conditions associated with the natural age-related rise in factor IX expression. Transgenic cells or animals associated vice age-related rise in factor IX expression. Transgenic cells or animals associated associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with associated with the natural associated with associated with the natural associated with associated with the natural associated with associated with associated with the natural associated with associated with the natural associated with associated with the natural associated with associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural associated with the natural

The present invention describes a transgenic algal cell (I) of the genus Chlamydomonas comprising reproductive genetic material comprising a nucleotide sequence capable of expressing chicken type I Metallothionein. Also described is a method of removing metal from an aqueous medium containing at least one dissolved or suspended metal. The transgenic algae are used for the selective separation of metals, particularly the separation of precious and desirable metals such as gold and uranium, from other metals such as cadmium, zinc and

Novel method for metal recovery, remediation and separation

The polymuclecutes sequences given in the polymuclecutes sequences ago the polymuclecutes of the polymuclecutes given in AAB44762 to AAB44811. AAB44812 to AAB44829 represent human secreted polypebtide sequences and proteins homologous to them, which are used in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities are: immunosuppressive; aniarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; erebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; and optibalmological. The polymucleotides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, coinchens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include pathological condition.
                                                                                                                                                     antificumatic; antiproliferative; cytostatic; cardiant; vasotropic; derebroprotective; noctropic; neuroprotective; antibacterial; virucide; funglicide; opthhalmological; gene therapy; autoimmune disease; infection; hyperproliferative disorder; cardiovascular disorder; angiogenesis; cerebrovascular disorder; nervous system disorder; ocular disorder; wound healing; skin aging; food additive; preservative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      disorders, infections caused by bacteria, viruses and fungi and ocular disorders. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase storage capabilities, AAC79790 to AAC79798 and AAB44761 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid encoding human secreted proteins, used to treat, prevent, ameliorate or diagnose medical conditions such as cancer, and

P. acres is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific, for P. acnes proteins. These antibodies can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABNI5762 to ABNI2752 encode the human ORFX proteins given in ABP0010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, orthogosis of liver, ostociatis, benign tumours, keloid, degenerative disorders, incorporative disorders related to organ transplantation, cardiovascular diseases, disorders related to organ response to the cardiovascular diseases, disbetes mellitus, systemic
                                                                                                                                                                                                                                                                                                                                                                                                                           Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; hypertension; hypothyroidism; cholesterol ester storage disease; autoimmune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis; myasthenia gravis.

                            lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune disorders such as multiple solerosis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. OREX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel human polypeptides and polymuclectides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders
                                                                                                                                                                                                                                                                                                                                                                                 Human ORFX protein sequence SEQ ID NO:2710.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; SEQ ID 2710; 1037pp; English.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 61, P
